```

```
The invention relates to short interfering nucleic acids (siNA) which CC downregulate expression of the one or more telemerase genes by RNA CC interference. The siNAs may or may not comprise ribonucleotides and may CC be double or single stranded. They further comprise sense and antisense CC regions, or alternatively are assembled from a sense oligonucleotide and cc interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short CC hairpin RNA (shRNA). The siNAs can be unmodified or chemically modified, CC can contain deoxyribonucleotides, and can be chemically synthesised, CC expressed from a vector or enzymatically synthesised. The invention also CC relates to kits for the in vitro or in vivo delivery of siNA; conjugates and/or complexes of siNA; and vectors that express siNA. The siNAs are CC used to modulate expression of the telomerase genes in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and CC transplants for the treatment of a variety of conditions. They may be CC used for treating cancer, restenosis, infectious diseases (specifically grotozoal), transplant rejection, or autoimmune or age-related diseases. (e.g., multiple sclerosis, lupus erythematosus, AIDS, macular degeneration, CC estimated diseases, therapeutic target identification and validation, CC enapping (e.g., of single nucleotide polymorphisms). The present sequence represents the upper strand of a human TERT-targeted double-stranded cc siNA, which is identical to the c-fos transcript target sequence.
Sequence 19 BP; 5 A; 7 C; 6 G; 0 T; 1 U; 0 Other;

              CC comprise ribonucleotides and may be double or single stranded. They CC further comprise sense and antisense regions, or alternatively are CC assembled from a sense oligonucleotide and an antisense oligonucleotide. Specifically, the siNAs include short interfering RNA (siRNA), double-CC Specifically, the siNAs include short hairpin RNA (shRNA). The siNAs CC can be unmodified or chemically modified, can contain CC deoxyribonucleotides, and can be chemically synthesised, expressed from a CC vector or enzymatically synthesised. The invention also relates to kits CC for the in vitro or in vivo delivery of siNA; conjugates and/or complexes CC of siNA; and vectors that express siNA. The siNAs are used to modulate expression of the IGF-IR gene in cells, tissue explants or organisms CC (e.g., by ex vivo gene therapy), or in grafts and transplants for the CC treatment of a variety of conditions. They may be used for treating CC cancer and other proliferative diseases (e.g., restenosis and polycystic kidney disease), inflammatory and/or allergic diseases, autoimmune CC diseases and transplant rejection. The siNAs are also useful for drug creening, diagnosis, therapeutic target identification and validation, pharmacorenomics at Maria Gene function and contains and con
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           20-FEB-2002; 2002US-035850P.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          RNA interference; short interfering nucleic acid; siNA; short interfering RNA; siRNA; double-stranded RNA; micro-RNA; mishort hairpin RNA; shRNA; expression modulation; gene therapy; drug screening; diagnosis; therapeutic target identification; pharmacogenomics; gene function analysis; gene mapping; cancer; proliferative disease; restenosis; polycystic kidney disease; inflammatory disease; allergic disease; autoimmune disease; transplant rejection; cytostatic; vasotropic; nephrotropic; antiinflammatory; antiallergic; immunosuppressive; human; insulin-like growth factor 1 receptor; IGF-IR; target sequence;
                                                                          The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the human insulin-like growth factor 1 receptor (IGF-IR) gene by RNA interference. The siNAs may or may not comprise ribonucleotides and may be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonucleotide and an antisense oligonucleotide.
                                                                                                                                                                                                                                                                                                                        diagnosis

                                                                                                                                                                                                                                                         밁
                                                                                                                                                             S
                                                                                                                                                                                                                                                                              The present invention describes a double-stranded short interfering nucleic acid (siNA) that downregulates expression of the vascular endothelial growth factor receptor (VEGFR) gene. Also described: (1) a siNA that downregulates the VEGF gene; (2) kits for in vitro or in vivo delivery of siNA; (3) conjugates and/or complexes of siNA; (4) vectors that express siNA; and (5) single-stranded siNA with similar properties. The siNAs have antiarthritic, antipsoriatic, nephrotropic and gynaecological, antiarthritic, antipsoriatic, nephrotropic and gynaecological activities. The siNA are useful for modulating (downregulating) the expression of VEGFR genes. The siNA are potentially useful for treating a wide range of angiogenesis-associated conditions, particularly cancers, diabetic retinopathy, macular degeneration, neovascular glaucoma, arthritis, psoriasis, endometriosis, angiofibroma, and polycystic kidney disease. The siNA may also be useful for diagnosis, drug screening, target identification, and also for gene mapping (e.g. of single-nucleotide polymorphisms). The present sequence is used in the exemplification of the present invention.
                                                                                                                                                                                            Query Match

CC endothelial growth factor receptor (VEGFR) gene. Also described: (1) a CC siNA that downregulates the VEGF gene; (2) kits for in vitro or in vivo Cd delivery of siNA; (3) conjugates and/or complexes of siNA; (4) vectors CC that express siNA; and (5) single-stranded siNA with similar properties. The siNAs have antianglogenic, cytostatic, antidiabetic, ophthalmological, antiarthritic, antipsoriatic, nephrotropic and CC ophthalmological activities. The siNA are useful for modulating CC useful for treating a wide range of angiogenesis-associated conditions, CC particularly cancers, diabetic retinopathy, macular degeneration, CC neovascular glaucoma, arthritis, psoriasis, endometriosis, angiofibroma, CC and sorreening, target identification and validation, genetic congineering, studying gene function, and also for gene mapping (e.g. of single-nucleotide polymorphisms). The present sequence is used in the expression of twonticm
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             20-FEB-2002;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    CC panishment the presence of a first prime homologous to the second co PCR in the presence of a first primer homologous to the second coportion, where the unknown region is amplified. In the method of coportion, where the unknown region is amplified. In the method of cassociated DNA sequence, the template polynucleotide comprises a sense cassociated DNA sequence, the template polynucleotide comprises a sense concercated comprises a first or second portion. The unknown region is concert the 3'-end of the sense strand than is the known region. The known region is comprises a first or second portion. The first portion is comparises a first or second portion. The first portion is comparise is complementary to the first portion. The loop-forming configuration to the second portion of the first portion. The third region complementary to the second portion is generated at the free end of the comprises ATF1 (not defined) or BCR (B cell receptor). The method is useful for amplifying an unknown region that flanks a known region of a concer-associated DNA sequence. Also disclosed as new is the use of the method in the analysis of the breakpoint region of the human MLL gene, where the chromosomal breaks results in gene fusions with AF-4, CDK-6 and CC septing and acute myeloid leukaemia). MLL is located on chromosome clu23. The present sequence is a primer used in the analysis of the MLL and SML is located on chromosome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

antiinflammatory, neuroprotective, anabolic, mootropic and cantiparkinsonian activities, and can be used in gene therapy. The NOVX csequences can be used as a therapeutic in the manufacture of a medicament for treating a syndrome associated with a human disease, such as a cpathology associated with NOVX. The NOVX proteins and nucleic acids encoding them are useful for diagnosing or treating pathologies, diseases or conditions associated with NOVX sequences, including cardiomyopathy, catheroselerosis, hypertension, congenital heart defects, pulmonary stenosis, scleroderma, obesity, metabolic disturbances associated with CC obseity, transplantation, adrenoleukodystrophy, congenital adrenal CC hyperplasia, prostate cancer, diabetes, metabolic disorders, neoplasm, CC adenocarcinoma, fertility, haemophilia, graft versus host disease, AIDS, CC disease, anorexia, neurodegenerative disorders (e.g. Alzheimer's disease, CC or parkinson's disease), immune disorders, haematopoietic disorders, dyslipidaemias, and wasting disorders associated with chronic diseases. CC or parkinson's disease, immune disorders, haematopoietic disorders, congenital asthma, crohm's disease, multiple sclerosis, infectious congenital asthma, crohm's disease, multiple sclerosis, infectious concents, and wasting disorders associated with chronic diseases. CC or parkinson's disease, immune disorders, haematopoietic disorders, congenital asthma, congenital as and as concents. The sequence mapping, congenital asthma as the disorders associated with chronic diseases. CC or and in forensic identification of a biological sample. The present con and in forents a PCR primer for a human NOVX sequence, which is used to an an analysing disease in the present invertion.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                obesity, multiple

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ફ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes a method of arraying genome clones. The method comprises; (a) clones of the genomic libraries contained in multiwell plates numbered for discrimination are mixed in each of the multiwell plates; (b) a primer designed based on the chromosome marker sequence is added to the mixture to carry out an amplification reaction; (c) a signal corresponding to the marker is detected from the resultant camplified product to specify the discrimination Nos. of the multiwell plates containing the clones having said marker sequence; (d) the order of the markers is changed so that the same discrimination Nos. succeed to the maximum in the specified discrimination Nos. to array the multiwell plates; (e) the clones in the multiwell plates of the specified condictions; (f) the mixed respectively in each wells of longitudinal and lateral directions; (f) the mixed clones are cultured and the resultant cultures are amplified by using the above primer; (g) signals and lateral directions; (f) the mixed clones are cultured and the camplified from the detected result; and (i) the clones are reconstituted as the positions on the chromosome and arrayed. The microarray is useful for gene analysis. ABIA2957 to ABIA5322 represent PCR primers for human chromosome 21g22.1, which are specifically claimed for use in the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

The primer is based on a polynucleotide product amplified by panhandle PCR, and was used in a validating PCR, generating a product of 411 nucleotides. The invention relates to methods for the panhandle PCR amplification of a region of DNA of unknown sequence that flanks a region of a leukaemia-associated gene, especially MLL, of known sequence in a human patient. When the method was applied to the ALL infant patient, a translocation breakpoint was identified at nucleotide 3802 of the breakpoint cluster region (bcr) of MLL, in MLL intron 8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Amplifying an unknown region flanking a known region of the leukemia-
associated MLL gene for diagnosing leukemia, comprises using a panhandle
polymerase chain reaction.
                                                                                 Amplifying an unknown region that flanks a known region of a cancer-
associated DNA sequence by subjecting the panhandle structure to
extension and to PCR in the presence of a first primer homologous to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequences AAS42806-AAS42926 represent cDNA molecules and PCR primers for cDNA molecules encoding human G-protein coupled receptor (GPCR) polypeptides. The protein and DNA sequences of the invention can be used to identify compounds which bind to GPCR polypeptides and in screening for compounds that modulate GPCR activity. By screening a human subject for the presence of mutations in GPCR DNA, a GPCR-related disorder or a genetic predisposition can be diagnosed. The sequences can also be used for treatment and prevention of mental disorders such as schizophrenia, attention deficit disorder, anxiety, depression, dementia and bipolar disorder, neurological disorders such as funtington's disease,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       02-MAR-2000;

nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid segment encoding (I). (I) can have antipsoriatic, dermatological, cytostatic, antiseborrheic, antidiabetic, antisickling, ophthalmological, vulnerary, keratolytic and virucide activities, and cleaves RNA encoding cytokine involved in inflammation. (I) can be used in gene therapy. (I) and (II) are useful for treating proliferative skin diseases such as psoriasis, atopic dermatitis, actinic keratosis, squamous or basal cell carcinoma and viral or seborrheic wart. They can also be used for treating proliferative eye diseases such as diabetic retinopathy, vitreoretinopathy, sickle cell retinopathy, retinopathy of prematurity and retinal detachment, and for treating and preventing scarring such as keloid, adhesion and hypertrophic or hypertrophic burn accar. AAH57577 to AAH62099 represent seguences used in the
                                                                                                                                                                                                                                                                                                                                                                  The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a ribozyme (I) which cleaves RNA encoding a cytokine involved in inflammation, matrix metalloproteinase (MMP), cyclin, cell-cycle dependent kinase, growth factor or a reductase, or administering a dependent kinase, growth factor or a reductase, or administering a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Treating proliferative skin or eye diseases and scarring, using ribozymes that cleave RNA encoding cytokines involved in inflammation, matrix metalloproteinases, growth factors and cell-cycle dependent kinases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Example 1; Page 323; 408pp; English.

                                                                                                                                                                                                                                                         S
                                                                                                                                                                                                                                                                                                                                                                        The present invention describes a method using novel primers involving the PCR-based determination of histocompatibility locus antigen B (HLA-B) (Class I group type betermining the HLA-B Class I group type of a subject comprises: (i) combining a group-specific untranslated region primer pair with a target DNA sample from the subject under conditions such that primer-based amplification of the target DNA may occur; and (ii) cetermining whether a nucleic acid product is produced by the amplification; where the ability of the primer pair to produce a nucleic acid product is associated with a particular HLA group type. The method can be used for HLA-B typing. In the method, the initial group specific amplification allows a PCR based separation of haplotypes in 95% of patient samples. It permits the resolution of cis/trans linkages of heterozygote sequencing results which cannot be achieved with other protocols. AAX37845 to AAX38286 represent DNA sequence used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                        Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to a hairpin or hammerhead ribozyme, designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase other than cell-cycle dependent kinases CDK1, PCNA and Cyclin B1.

Representative examples of ribozyme recognition sites are given in AAA82415 to AAA86787. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme into cells. The ribozyme is resistant to endonuclease activity and hence is efficient in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; G-protein coupled receptor; GPCR; mental disorder; schizophrenia;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 19 BP; 5 A; 4 C; 3 G; 7 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Disclosure; Page 99;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New hairpin and hammerhead ribozyme RNA encoding a cyclin or cell-cycle PCNA and Cyclin B1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            04-DEC-1998;

                        Sequences were determined from the ends of chromosome 11-specific cosmids by automated sequencing without intermediate subcloning. A sample of 371 DNA sequence fragments were determined and of these, 277 were suitable for STS primer prediction by computer analysis (using the Primer program available from E.Lander, MIT). The STSs and cosmids were mapped by in situ hybridisation, somatic cell hybrid analysis or both. Using this method, 370 STSs specific for human chromosome 11 were generated and most of them were regionally mapped. This procedure illustrates a novel method for sequencing complex genomes, designated "sequence sampled mapping". The sequence sampled mapping method is useful for the completion of high density sequence-based maps, and ultimately, for the complete sequencing of genomic DNA directly from cosmid clones. See AAQ8201-Q82706 for STS primers. (Updated on 25-MAR-2003 to correct PN
                                                                                                                                                                                                                                                                                  Sequencing complex genomes, present as fragments in a cosmid library sequencing end-specific nucleotides of each clone then correlating wispatial relationship of cosmid, esp. for mammalian chromosomes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to a method of inhibiting osteoclast-mediated bone resorption, comprising inhibiting the expression of an osteoclast associated gene or the activity of a gene product encoded the osteoclast associated gene. The method is useful in inhibiting osteoclast-mediated bone resorption. The present sequence is a Brn3 transcription factor binding site shown in the exemplification of the

                                                                                                                         AAV46054 and AAV46200-V46264 are primers used in isolating human histocompatibility locus antigen (HLAA) Class I alleles which are used in a novel method of HLA Class I typing. The method involves combining a group-specific untranslated region primer pair with a target DNA to allow primer-based amplification of the DNA, and determining whether a nucleic acid product is produced by the amplification. The ability of the primer pair to produce a product is associated with a particular HLA group type. The methods can be used for typing the 3 classical HLA Class I genes (comprising the loci HLA-A, HLA-B, and HLA-C) in e.g. donors and hosts for tissue transplantation. The initial group specific amplification allows a PCR based separation of haplotypes in 95% of patient samples. The subsequent sequencing can provide for high-resolution typing
                                                                                                                                                                                                                                                                                                                            HLA Class I typing - by primer-based amplification group-specific untranslated region primer pair.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         neuroprotective, nootropic, anorectic, antidiabetic, antimicrobial, and antilipaemic activity, and may have a use in gene therapy, and as a vaccine. The polypeptides are encoded by NOVX polynucleotides comprising any of the 303 fully defined nucleotide sequences given in the specification. The polypeptide is useful in the manufacture of a medicament for treating a syndrome associated with a human disease. The polypeptide, polynucleotide and antibody are useful in diagnosing, treating or preventing NOVX-associated disorders, e.g. cancer, cachexia, Alzheimer's disease, Parkinson's disease, obseity, diabetes, infectious diseases, metabolic syndrome X or dyslipidaemias. The nucleic acids are further used as hybridisation probes, in chromosome mapping, tissue typing, preventive medicine, and pharmacogenomics. The present sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 18 BP; 1 A; 10 C; 1 G; 6 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CC. or chronic obstructive pulmonary disease. The method comprises conditions the expression level of a marker gene in a biological sample cc expression level of the marker gene in a biological sample cc expression level of the marker gene in a biological sample from a healthy constructive pulmonary disease. The marker gene comprises: (a) a group of genes (S1) whose expression levels increase when respiratory epithelial cc cells are stimulated with interleukin-13; or (b) a group of genes (S2) cells are stimulated with interleukin-13; or (b) a group of genes (S2) consisted for bronchial asthma or chronic obstructive pulmonary disease; (c) a kit for screening for a candidate compound for a therapeutic agent ct to treat bronchial asthma or chronic obstructive pulmonary disease; (2) a kit for screening for a candidate compound for a therapeutic agent cc disease; (4) an inducer that induces bronchial asthma or chronic obstructive pulmonary disease; (5) a marker gene, a naimal model for bronchial asthma or chronic agent for bronchial asthma or chronic obstructive pulmonary disease; (6) a therapeutic agent for bronchial asthma or chronic obstructive pulmonary disease; (7) a marker gene, a ribozyme, a polymucleotide that suppresses the compound, a protein actima or chronic obstructive pulmonary disease, comprising the compound, or a protein actima or chronic obstructive pulmonary disease, on which a protein actima or chronic obstructive pulmonary disease, on which a compound and antiashmatic activities, and can be used in gene therapy. The method cis useful for testing for or screening for a therapeutic agent for method cis useful for testing for or screening for a therapeutic agent for method cis useful for testing for a compound compound. The method compound co

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This invention relates to a novel method for the prediction, diagnosis, or prognosis of malignant neoplasia by the detection of at least two markers. The invention may also be useful for the development of cytostatic compounds through the regulation of the expression of a gene or activity of a protein associated with malignant neoplasia. The method is useful for prediction, diagnosis or prognosis of malignant neoplasia compounds the cancer, ovarian cancer, gastric cancer, colon cancer, colon cancer, coesophageal cancer, mesenchymal cancer, bladder cancer or non-small cell ung cancer. The polynucleotides and polypeptides defined in the specification, antisense polynucleotides targeting the polynucleotides, antibodies targeting either one of the polynucleotides or polypeptides, antibodies targeting malignant neoplasia. The disease treated is preferably breast cancer. The present sequence is that of a PCR primer or which was used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match

A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a cuse in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of adenosine of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of adenosine creceptor, producing bronchodilation, increasing levels of adenosine freeptor, producing bronchodilation, increasing levels of adenosine creceptor, producing bronchodilation, increasing levels of this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO as for wino int/pub/hublished not semences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match

The coligonucleotides are derived from a gene encoding or regulating cypression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA. Cc The invention also describes a kit, that comprises: (a) a delivery construction of the invention has antiallergic, antiinflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The composition such as pulmonary vasoconstriction, and/or bronchoconstriction and/or lung inflammation, allergies and/or bronchoconstriction and/or lung confilammation, allergies, asthma, impeded respiration, respiratory transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to the oligonucleotides into products that free adenosine into the system content on the defects due to it.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to novel oligomers which have enhanced ability with respect to forming duplexes or triplexes. The oligomers comprise at least three 3'-5' linked nucleosides or their salts. At least one internucleoside linkage is not a phosphodiester linkage and at least one nucleoside comprises a base. Sequences of the invention are useful for binding to a DNA duplex target sequence via either CT or GT triplex helix binding motif and in antisense therapies. They are also used for treating diseases caused by viruses and for disgnostic applications to detect viral infections, bacterial infections and diseases such as cancers. The oligomers are also used as primers, in the treatment of pathological conditions associated with inflammatory conditions, cardiovascular disorders, immune reactions and bacterial infections and therapy. The present sequence is an oligomucleotide used to illustrate the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              comultiwell plates numbered for discrimination are mixed in each of the cumultiwell plates; (b) a primer designed based on the chromosome marker containing the corresponding to the marker is detected from the resultant amplified product to specify the discrimination Nos. of the multiwell containing the clones having said marker sequence; (d) the order cof the markers is changed so that the same discrimination Nos. succeed to the maximum in the specified discrimination Nos. to array the multiwell cof the maximum in the specified discrimination Nos. to array the multiwell plates; (e) the clones in the multiwell plates of the specified constination Nos. are mixed respectively in each wells of longitudinal and lateral directions; (f) the mixed clones are cultured and the creation cultures are amplified by using the above primer; (g) signals are detected from the amplified by using the above primer; (g) signals are detected are specified from the detected result; and (1) the clones are creonstituted as the positions on the chromosome and arrayed. The mixed constituted as the positions on the chromosome and arrayed. The creonstituted as the positions on the chromosome and ABI45322 represent PCR primers for human chromosome 1936-35 DNA, and ABI45323 to ABI45634 represent PCR primers for human chromosome 21q22.1, which are specifically claimed for use in the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match

The invention provides for the use of antagonists of P450 enzymes for the correction or alleviation of a tachyphylactic response to administration of a vitamin D analogue, corticosteroid or macrolactam to a patient, e.g. for the treatment of psoriasis. It is based on the finding that the underlying cause of tachyphylaxis (tolerance) is the degradation of a drug in the patient, rather than desensitization or receptor down-cregulation. Exposure of a patient to a drug for extended periods results in an increase in the expression of enzymes which are capable of metabolizing that drug. A method for treatment of tachyphylaxis involves inhibiting the induced metabolic enzyme by administration of an antagonist of the enzyme. Detection of an increase in the amount and/or activity of a metabolic enzyme capable of metabolizing a drug following extended exposure of a cell from an individual to the drug indicates the increased likelihood of that individual developing a tachyphylactic

                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence is a sense primer for cytochrome P450 CYP1A1. RT-PCR was used to characterise metabolic enzyme induction by vitamin D analogues, corticosteroids and macrolactams in human skin. Expression of CYP1A1 increased in skin taken from psoriatic volunteers who exhibited tachyphylaxis after extended treatment with the macrolactam Tacrolimus.
                                                                                      Sequence 18
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Alleviating or preventing a tachyphylactic response to an agent and treating psoriasis, comprises administering an antagonist of a metabolic enzyme, which is induced as a result of exposure to the agent, to a

cc factor-1 (CSF-1) encoding DNA. This sequence can be medified to produce CC high levels of long and short forms of CSF-1 and their truncated forms in CC particular systems such as E. coli. The invention relates to human and CC murine carboxy truncated forms of colony stimulating factor-1 (CSF-1) and CC their corresponding cDNA molecules. CSF-1 is a lymphokine useful for CC stimulating monocyte- precursor/macrophage cell production from CC progenitor bone marrow cells, enhancing the effectiveness of the immune CSF-1 is used as an adjunct to chemotherapy, in the restimulation CC of the immune system, and in treating leukaemia through bone marrow CC transplants or other accidental forms of immunosuppression such as CC Acquired Immune Deficiency Syndrome (AIDS). CSF-1 stimulates the CC production of lymphokines by macrophages and enhances their ability to infections. It is also used for treating granulocytopenia and CC macrophagocytopenia in patients receiving cancer therapy and for patients with implanted bone marrow. CSF-1 cDNA is also used in gene therapy. CSF-1 is used to destroy the invading organisms or malignant cells indirectly by the stimulation of macrophage secretions and activity

CC sequence; (2) analysing (MI) at least one nucleic acid sample comprising containing the sample from one or more polymorphic positions in a gene concloin a protein selected from the group above; (3) constructing (M2) the protein selected from the group above; (3) constructing (M2) an individual at risk of developing a disorder cupon administration of an ACE inhibitor and/or vasopeptidase inhibitor comprises one or more polymorphic positions within a gene encoding a mainteraction of an ACE inhibitor and/or vasopeptidase inhibitor comprises one or more polymorphic positions within a gene encoding a comprise one or more polymorphic positions within a gene encoding a comprise one or more polymorphic positions within a gene encoding a comprise one polymorphic position, and comparing the nucleic acid sample, determining the nucleotide present in at least one polymorphic position, and comparing at least one position with a known data set. The genes, (M1, M2, M3 and M4) and compositions are useful for detecting, diagnosing, treating, compressed in the analysis of involve angiogenesis like haemangiomas, tumours, sarcomas, Crohn's disease, trachomas, and cardiovascular diseases like angina pectoris, hypertensitivity reactions, sepsis, autorimmune diseases, and pectoris, proteins and disease, arteriosclerosis and/or atherosclerosis, and pectorios constructive pulmonary disease (COPD) and enterocolitis (many other constructive pulmonary disease (COPD) and enterocolitis (many other constructions). The sarcoman and diseases and diseases are listed in the specification. Antibodies
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                tachykinin receptor B1 (BDKRB1), clasterase inhibitor (CINH), kallikrein (KLK1), bradykinin receptor B2 (BDKRB2), angiotensin converting enzyme 2 (ACE2) or protease inhibitor 4 (PI4), comprising at least one polymorphic position. Also included are (1) a probe that hybridises to a polymorphic position as provided in the detailed summary of single nucleotide polymorphisms comprising additional 5 and 3 flanking genomic seguence; (2) analysing (M1) at least one nucleic acid assertion.
                                                polynucleotides are also useful for chromosome identification. Antibodies against the proteins may be utilised for immunophenotyping of cell lines and biological samples. The present sequence is a genotyping PCR primer for the gene encoding one of the proteins listed above
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 autoimmune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New

CSF-1 induces the formation of colonies containing predominately macrophages. CSF-1 is useful for producing an N terminal carboxy truncated CSF-1 polypeptide which is useful for enhancing effectiveness of immune system, stimulating functions of differentiated cells, as anti-infective, anti-viral, anti-microbial agent and for overcoming the immunosuppression induced by chemotherapy and resulting from other causes. CSF-1 is also directly useful in treatment of neoplasms and infections. CSF-1 destroys microorganisms or malignant cells indirectly by stimulating macrophage secretions and activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Disclosure; Col

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence is that of modified DNA encoding the N-terminal region of human colony stimulating factor-1 (CSF-1) mature protein. Deletion of 2 or 3 N-terminal residues of CSF-1 facilitates recombinant expression of the protein in bacterial host cells. The invention provides N-terminally deleted, C-truncated CSF-1 muteins (see AAB19532-42) that are capable of stimulating monocyte precursor/macrophage cell production from progenitor bone marrow cells. They can be used to treat an immunosuppressed patient following chemotherapy, bone marrow of neoplasms transplantation or disease, as well as in the direct therapy of neoplasms
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       88.
                                                                                                                                                                                                                                                    14-JUN-1985;

The invention relates to a carboxy truncated version of the CSF-1 short form protein having residues 3-158 (CSF-1 is useful in regulating the immune system following immunosuppression induced by chemotherapy and also for treating patients in the immunosuppressed state (to prevent rejection) after treatment for leukaemia through bone marrow transplants. CSF-1 enhances the growth are

CC The antisense oligonuclectides and (I) can be used to down-regulate the CC surgression and or activity of target polypeptides associated with CC lung/respiratory disorders and malignancies, such as stimulating and activating peptide factors and transmitters, transcription factors, CC immunoglobulins and antibodies, antibody receptors, cytokines and CC chemokines, endogenously produced specific and non-specific enzymes, binding proteins, adhesion molecules and their receptors, cytokine and CC chemokine receptors, adenosine receptors, bradykinin receptors, central nervous system peptide receptors, binding proteins and peripheral nervous and non-nervous system peptide cransmitters, defensins, growth factors, vasoactive peptides and CC receptors, binding proteins and malignancy associated proteins. The antisense oligonucleotides may be used in this way to treat disorders including respiratory obstruction (especially pulmonary obstruction and/or lung inflammation, allergy(ies) and/or sondition selected from pulmonary vasoconstriction, inflammation, condition selected from pulmonary vasoconstriction, inflammation, pulmonary distress syndrome (RDS), pain, cystic fibrosis (CF), allergic rhinitis (AR), pulmonary conditions, and conditions, pulmonary vasoconstriction, and post pulmonary distress syndrome (CC pulmonary transplantation rejection, pulmonary distress syndrome (CC pulmonary transplantation of ARF21543 represent human polynucleotide the present invention of

AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ69579 to AAZ77440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the

AAZ69579 to AAZ77440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential efficacious responses to and side effects from pharmaceutical agents acting on a disease as well as other treatment.

    The present invention describes a pharmaceutical composition, comprising at least one agent (I) that prevents, alleviates and/or inhibits adenosine-mediated cardiopulmonary and/or renal damage and/or failure.

(I) is an adenosine A2a receptor agonist (Ia), or an oligonucleotide (Ib), containing less than 15% adenosine (A), that is antisense to targe genes or corresponding RNA, to genomic flanking regions (i.e. 5' or 3' ends or segments between coding and non-coding sequences), or to all segments of mRNA encoding the adenosine A1, A2a bor A3 receptors, thas A1, A2b or A3 agonist activity or A2a antagonist activity (or at least no agonist activity at this receptor). (I) may be a mixture of (least no agonist activity at this receptor).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   adenosine A2a receptor; adenosine Ab receptor; adenosine A3 receptor phosphorothicate; cardiopulmonary failure; renal failure; ischaemia; endotoxin release; ARDS; acute respiratory distress syndrome; cytoprotective; anti-allergic; anti-inflammatory; anti-hypoxic; supraventricular tachycardia; allergic rhinitis; acute inflammation; chronic obstructive pulmonary disease; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 agents and diagnostic methods, as well as the characterisation differential efficacious responses to and side effects from pharmaceutical agents acting on a disease as well as other tr. PCR was used in an experiment examining the effects of connective tissue growth factor (CTGF) on mesangial cell matrix production. The CTGF gene had been identified, using a novel cells. To investigate the direct effects of CTGF up-regulation, mesangial cells are incubated with recombinant CTGF protein. This resulted in up-regulation of cell collagens I and IV and fibronectin. These proteins typify matrix accumulation as seen in diabetic nepropathy (DN). The invention provides methods for identifying genes having a role in the presentation of DN. These genes can be used as a diagnostic marker for the progression and presentation of DN, and as an index of disease activity and the rate of progression of DN, and as a basis for identifying drugs for use in the presentation of DN, and as a basis for identifying drugs
                                                                                                                                                                                                                                     Human; Ship inhibition;
                                                                                                                                                                                                                                                                                 Human Ship-2 phosphorothicate antisense oligonucleotide #30704
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        genes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Identifying genes used for identifying drugs for the prevention and/or therapy of diabetic nephropathy involves culturing mesangial cells in the presence of glucose which induces differential expression of susceptible

Also described is a method of inhibiting the expression of Ship-2 in human cells or tissues in vitro comprising contacting the cells with the phosphorothioate antisense oligonuclectides. The phosphorothioate antisense oligonuclectides can be used to treat animals (especially humans) suspected of having or being prone to a disease or condition associated with Ship-2 expression. The present sequence represents a phosphorothioate antisense oligonucleotide for human Ship-2, from the

cc antiasthmatic, cytostatic and analgesic activities. The compositions are cuseful for the treatment of diseases associated with inflammation, cc impaired airways, including lung disease and diseases whose secondary cc impaired airways, including lung disease and diseases whose secondary cc effects afflict the lungs of a subject. They can be used for treating cc e.g. ischaemic conditions, pulmonary vasoconstriction, allergies, asthma, cc fibrosis, pulmonary hypertension, emphysema, chronic obstructive cc pulmonary disease (COPD), and cancers such as leukaemias, lymphomas, cc carcinomas, and cancers which may metastasise to the lungs, including cc breast and prostate cancer. The reduction of the adenosine content of the CC ons reduces side effects. The A-containing ONs break down with the cc preciously prostate cancer in the sequence listing from the present the nucleotide sequences given in the sequence listing from the present cc invention, which correspond to SEQ ID NO:11 to 185, but the sequences differ cc from the previously named sequences. SEQ ID NO:11 to 1880 (AAA33231 to AAA33392) are specifically claimed ONs from the present invention on thatch cc up with their corresponding SEQ ID NO:1 to 1880 (AAA33231 to AAA33992) are specifically claimed ONs from the present invention on thatch cc listing for the present invention do not match cc listing for the sequence of the present invention do not match corresponding SEQ ID NO: sequences given in the sequence cc listing form the present invention on the match cup with their corresponding SEQ ID NO: sequences given in the sequence corresponding SEQ ID NO: sequences given in the sequence corresponding SEQ ID NO: sequences given in the sequence corresponding SEQ ID NO: sequences given in the sequence corresponding SEQ ID NO: sequences given in the sequence corresponding SEQ ID NO: sequences given in the sequence corresponding SEQ ID NO: sequences given in the sequence corresponding SEQ ID NO: sequences given in the sequence corresponding SEQ ID NO: sequences giv

                                                                                                                                                           RESULT 1998
                                                                                                                                                                                                                                                                                                                                                          This sequence represents an antisense oligonucleotide used to test the method of the invention. The method of the invention is for evaluation of method of the invention. The method of the invention is for evaluation of comprises: microinjecting varying amounts of the antisense oligomer into a host cell along with a target vector for the expression of a gene containing a target sequence for the antisense oligomer and a control vector for the expression of a control gene that encodes a detectable protein and does not contain the target sequence; and measuring inhibition of the target gene expression, but not of the control gene expression, as the amount of antisense oligomer increases indicates the ability of the antisense oligomer to inhibit gene expression. The oligomers have enhanced affinity for complementary target nucleic acid sequences and improved binding affinity for double-stranded and/or single-stranded target
                                                                                                                                                                                                                                                            Query Match

                                                                                                                                                This invention describes the construction of a novel vector for sulfate transporter expression containing a DNA sequence encoding a mammalian sulfate transporter (expression product of the DTDST gene) and containing no DNA sequence of 5 translation region of the mammalian sulfate transporter gene. The invention also describes; (A) a method for screening a human bone/carrilage disease treating agent including the steps: (1) transforming an animal cell with the above vector, (2) culturing the animal cell in the presence of a sample and (3) detecting the increase in the sulfate ion intake to the cell; (B) a drug preparation for the treatment of human bone/carrilage disease containing the above vector as the active component. The sulfate transporter genecontaining vector is high in expression efficiency. AAX78055-X78073 are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Synthetic.

                                    The sequences given in AATS8754-55 represent the 5' terminal sequences derived from an over expressing clone and the corresponding wild type sequence from the long form of human colony stimulating factor (HuCSF)-1 (LCSF). In the over expressing form the codons for the first six amino acids of LCSF were altered to those favoured in bacteria. This results in higher levels of production of both the full length LCSF protein and truncated versions of it (see also AAMM1072-86). The truncated proteins pref. have 3 amino acids deleted at the N-terminal end, and a variable number deleted from the C-terminal end. The truncated proteins have mol. wts. much closer to those found in naturally occurring CSF-1 dimers, and it is thought that natural CSF-1 may be C-terminally truncated. The novel proteins may be useful for overcoming immuno- suppression induced e.g. by Chemotherapy, bone marrow transplantation or diseases, e.g. ALIDS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               05-FEB-1985;

                                                                                                                                                                                                                                                                     A method for treating airway disease in a subject has been produced, which involves the topical administration of an essentially adenosine free antisense oligonucleotide (ON) to the airway epithelium of the subject. The present sequence is an antisense oligonucleotide HSA2ARECAS7 specific for the human A2a adenosine receptor. The method can be used to treat airway diseases such as cystic fibrosis, asthma, chronic obstructive pulmonary disease, bronchitis and o, tariway diseases characterised by an inflammatory response. By eliminating adenosine from the antisense ON, its liberation upon antisense degradation is prevented, thereby preventing adenosine-induced bronchoconstriction in patients with

This invention relates to a novel method for generating and detecting target nucleic acid sequences. Specifically, it refers to the use of a structure specific nuclease, alone or in combination with nucleic acid polymerase, especially the ones lacking 5' nuclease activity that can detect and measure target polymucleotides. The present invention describes using a probe with a signalling moiety that is inactivated unless hybridised to the target where upon the resulting double stranded duplex provides a suitable substrate for the structure specific nuclease and generation of the detectable signal. Accordingly, the method is useful for generating a signal that indicates the presence of a target
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to an enzymatic nucleic acid molecule which specifically cleaves RNA derived from hepatitis C virus (HCV), in which the binding arms of the enzymatic nucleic acid molecule comprises sequences complementary to any of the defined substrate sequences given in the specification. The nucleic acid molecule may be administered for the treatment of HCV infections, especially in combination with type I interferons. The present sequence represents a HCV DNAzyme substrate
                                                                                                                                                                                                                                                                                                                                                                                           Generating a signal indicative sequence in a sample comprises structure specific nuclease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Enzymatic nucleic acid molecules which specifically cleave RNA derived from hepatitis C virus (HCV), useful for the treatment of HCV infectio especially in combination with type I interferon therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 09-DEC-2002; 2002US-0431822P
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             08-DEC-2003; 2003WO-US039199

                                                           used in a method to detect a mutation in the glucocerebrosidase gene, corresponding to an insertion of a G nucleotide adjacent to base 57 of exon 2 (see also AAQ)3287 and AAQ)3304). The template DNA used was isolated from peripheral blood leukocytes. Glucocerebrosidase is an enzyme which is required for the lysosomal degradation of glycolipids (see also AAQ)3286). A deficiency of this enzyme leads to Gaucher disease, as in the absence of glucocerebrosidase, the extremely insoluble glucosylceramide (glucocerebroside) accumulates. The insertion of a G nucleotide adjacent to position 84 in the glucocere- brosidase cDNA has been characterised as a new Gaucher disease causing mutation. The

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to an enzymatic nucleic acid molecule that specifically cleaves RNA derived from hepatitis B virus (HBV) and comprising one or more binding arms, without requiring the presence of a 2'-OH group within the molecule for activity. The nucleic acids are useful for treating hepatitis B virus infection, hepatitis, hepatocellular carcinoma, cirrhosis and liver failure, either alone or in combination with other therapies such as lamivudine and interferons. The nucleic acids are useful as diagnostic tools to examine genetic drift and mutations within diseased cells, for detecting the presence of HBV RNA in a cell, for the study of RNA and for down-regulating gene expression of target genes in bacterial, fungal, viral, plant or mammalian cells. This sequence represents an HBV RNA target sequence, used in the scope of the invention. Note: The sequence data for this patent is also available in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   14-MAY-1992;

The nucleic acid molecule may be administered for the treatment of HCV infections, especially in combination with type I interferons. The present sequence represents a HCV DNAzyme substrate

                                                                                                                                                                                                                                                                                                                                                            The present invention is based upon methods of treating inflammatory conditions in the intestinal tract of mammala using fibroblast growth factor (FGF)-CX and/or FCTRX(undefined) polypeptides and their encoding polynucleotides. The invention is useful for treating inflammatory pathology such as inflammatory bowel disease, inflammatory condition occurring in the colon or small intestine and Crohn's disease. The invention is also useful in gene therapy. The present sequence is human intestinal trefoil factor (ITP) amplifying RT-PCR primer. The primer is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Promoting the growth of a population of cells, useful for treating inflammatory conditions, comprises contacting the at least one cell with a composition comprising FGFCX and/or FCTRX polypeptides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Homo

                                               Hepatitis I
hepatitis I
cirrhosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                 combination with other therapies such as lamivudine and interferons. The nucleic acids are useful as diagnostic tools to examine genetic drift and mutations within diseased cells, for detecting the presence of HBV RNA in a cell, for the study of RNA and for down-regulating gene expression of target genes in bacterial, fungal, viral, plant or mammalian cells. This sequence represents an HBV RNA target sequence, used in the scope of the invention. Note: The sequence data for this patent is also available in electronic format from USPTO at seqdata.uspto.gov/sequence.html.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to an enzymatic nucleic acid molecule that specifically cleaves RNA derived from hepatitis B virus (HBV) and comprising one or more binding arms, without requiring the presence 2'-OH group within the molecule for activity. The nucleic acids are useful for treating hepatitis B virus infection, hepatitis, hepatocellular carcinoma, cirrhosis and liver failure, either alone
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel enzymatic nucleic acid molecule such as DNAzymes and inozymes specifically cleaving RNA derived from hepatitis B virus and comprione or more binding arms, useful for treating hepatitis and cirrhos
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           (DRAP/)

```

The invention relates to a nucleic acid molecule that down-regulates CC expression of Grb2-related with insert domain (GRID) gene, e.g. a. CC hammerhead ribozyme, NCH ribozyme, G-Cleaver ribozyme, Zinzyme, DNAzyme, CC amberzyme, Inozyme or hairpin ribozyme. Also include are a mammalian cell including the novel nucleic acid molecule, reducing GRID activity in a CC cell by contacting the cell with the novel nucleic acid molecule, cell with the level of GRID (c.g. tissue/graft rejection or leukaemia) by contacting the cell with the novel nucleic acid molecule, cleaving RNA of a GRID gene by CC contacting the cell with the novel nucleic acid molecule, an expression CC vector comprising a nucleic acid sequences (encoding at least the novel nucleic acid molecule in a manner that allows its expression), a ccid molecule in a manner that allows its expression), a caid molecule that cleaves RNA derived from a GRID gene. The nucleic acid molecule that cleaves RNA derived from a GRID gene. The nucleic acid molecule that cleaves RNA derived from a GRID gene. The nucleic acid molecule that cleaves RNA derived from a GRID gene. The nucleic acid molecule that cleaves RNA derived from a GRID gene. The nucleic acid molecule that cleaves RNA derived from a GRID gene. The nucleic acid molecule that cleaves RNA derived from a GRID gene that the level of GRID, e.g. tissue/graft rejection and leukaemia. The present sequence is ccompared to the invention. The invention relates to a nucleic acid molecule that down-regulates compression of Grb2-related with insert domain (GRID) gene, e.g. a comparison of Grb2-related with insert domain (GRID) gene, e.g. a comparison of Grb2-related with insert domain (GRID) gene, e.g. a comparison of Grb2-related with insert domain (GRID) gene, DNAyme, CC amberzyme, Inozyme or hairpin ribozyme. Also include are a mammalian cell cincluding the novel nucleic acid molecule, reducing GRID activity in a conclusion associated with the level of GRID cell by contacting the cell with the novel nucleic acid molecule, cleaving RNA of a GRID gene by contacting the cell with the novel nucleic acid molecule, an expression contacting the cell with the novel nucleic acid molecule, an expression contacting the cell with the novel nucleic acid molecule, an expression contacting the cell in a manner that allows its expression), a contacting the cell including the expression vector and an enzymatic nucleic acid molecule is useful for treating a condition associated with the level of GRID, e.g. tissue/graft rejection and leukaemia. The present sequence is carget region for the enzymatic nucleic acids of the invention.

                                                                                                              invention relates to these sequences or sequences having at least 80% identity to them, and polypeptides encoded by the sequences or polypeptides having 80% identity to the polypeptides encoded by the sequences or polypeptides having 80% identity to the polypeptide sequences. The invention is used to diagnose or treat viral disease or disease characterized by development of tumour cells or cellular decemparation.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ADM54206
                                                                                                                                                                                                                           The invention relates to a nucleic acid molecule that down-regulates compression of Grb2-related with insert domain (GRID) gene, e.g. a hammenhead ribozyme, NCH ribozyme, G-cleaver ribozyme, Zinzyme, DNZyme, CC hammenhead ribozyme or hairpin ribozyme. Also include are a mammalian cell including the novel nucleic acid molecule, reducing GRID activity in a cell by contacting the cell with the novel nucleic acid molecule. Treating a patient having a condition associated with the level of GRID (e.g. tissue/graft rejection or leukaemia) by contacting the cell with the novel nucleic acid molecule, cleaving RNA of a GRID gene by contacting the cell with the novel nucleic acid molecule, an expression vector comprising a nucleic acid sequences (encoding at least the novel nucleic acid molecule in a manner that allows its expression), a condition acid molecule that cleaves RNA derived from a GRID gene. The nucleic acid molecule that cleaves RNA derived from a GRID gene. The nucleic acid molecule is useful for treating a condition associated with the level of GRID, e.g. tissue/graft rejection and leukaemia. The present sequence is a target region for the enzymatic nucleic acids of the invention.
                                                                                            Matches
                                                                                                                                         Query Match
                                                                                                                                                                                        Sequence 17
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New nucleic acid molecule that down-regulates expression of Grb2-related with insert domain (GRID) gene, useful for treating a condition associated with the level of GRID, e.g. tissue/graft rejection and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          in the phenomena of tumour suppression, tumour reversion, apoptosis and/or resistance to viruses. The invention may be useful for the development of compounds with a cytostatic, virucide, neuroprotective, nootropic or neuroleptic activity. The DNA sequences may be useful as probes and primers for detecting, indentifying, quantifying and/or amplifying nucleic acid, for example as one component of a gene chip, in vitro as antisense reagents and for production of recombinant polypeptides. The invention may therefore be useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schizophrenia. The present sequence is that of a nucleic acid sequence of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells.
                                                                                                                  New isolated nucleic acid, useful for treating viral diseases with tumors and cell degeneration, also related polypeptides,
                                                                                                                                                                                                                                                                                                                                                                                         17-SEP-2001; 2001FR-00011980

in the phenomena of tumour suppression, tumour reversion, apoptosis cand/or resistance to viruses. The invention may be useful for the celebrate of compounds with a cytostatic, virucide, neuroprotective, notropic or neuroleptic activity. The DNA sequences may be useful as probes and primers for detecting, indentifying, quantifying and/or amplifying nucleic acid, for example as one component of a gene chip, in vitro as antisense reagents and for production of recombinant of pharmaceuticals for prevention may therefore be useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration. The specifically cancer but also Alzheimer's disease and schizophrenia. The present sequence but also Alzheimer's disease and schizophrenia. The specification, but was obtained in electronic format directly from WIPO specification, but was obtained in electronic format directly from WIPO

WPI; 2003-430470/40

New pharmaceutical composition having a MAP kinase interacting kinase nucleic acid or polypeptide, useful for diagnosing, preventing and/or treating disorders related to weight-regulation and thermogenesis.

Example 9 Page 67; 120pp; English.

i.e. adipose and muscle tissue. It was upregulated during human adipocyte differentiation. The invention relates to Mnk proteins, and the nucleic acids encoding them, and their use in the diagnosis, study, prevention The present sequence is a reverse primer for the mouse MAP kinase-interacting kinase 2b (Mnk2b) gene. It was used in a Taqman analysis of Mnk2 expression. Mnk2b was expressed in all tissues examined, with highest expression levels in tissues relevant for metabolic disorders, 얁
